TAILOR APP - FRONTEND AUDIT

Mobile UI Visual Reference & Screen Architecture Catalog

Audited Framework: Ionic 8 + Angular 19 Standalone | Date: October 2026

Executive Summary of Visual UI Implementation

This document contains verified mobile screen references captured directly from the live compiled application in mobile viewport mode (390 x 844 px, iPhone 14 / modern smartphone scale).

Key Audit Visual Findings:

- **14 active views/modals successfully render functional interfaces.**
- **2 empty placeholder views exist in source code without active routing (WithoutFabric, Registration).**
- **Navigation bar (Footer) is globally embedded, creating unauthorized redirects if not guarded.**
- **The UI mixes Tailwind CSS classes, Bootstrap components, and Ionic SCSS variables.**
- **Cart and Order Summary screens currently function against LocalStorage instead of backend APIs.**

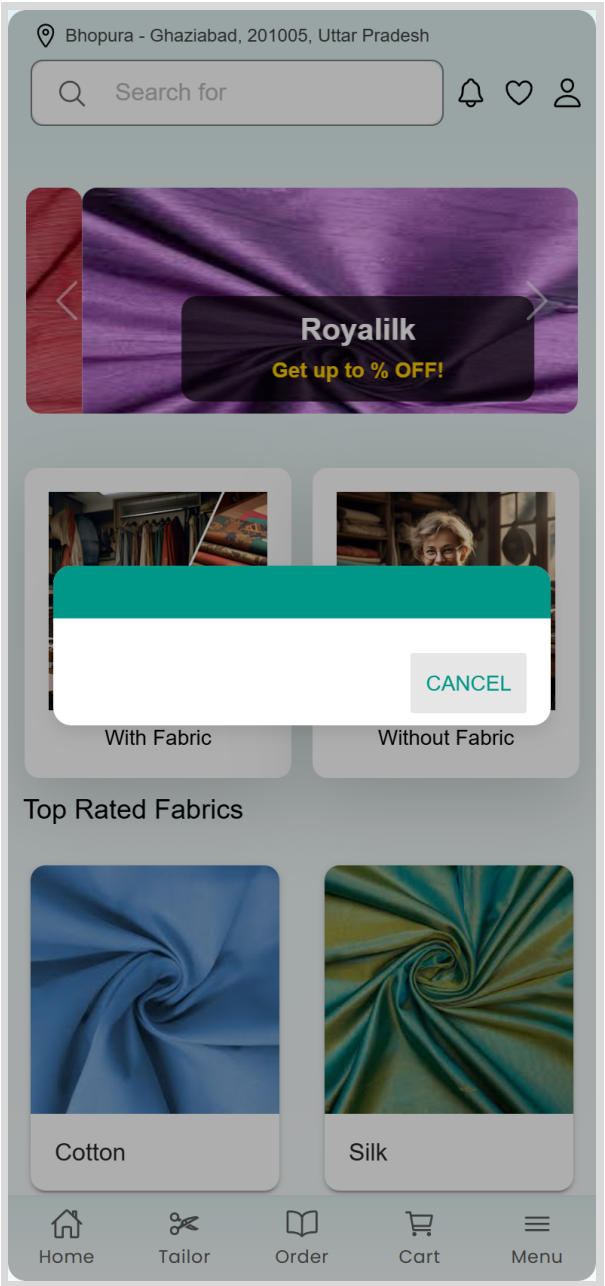

Screen Catalog Inventory Included in this Document:

1. Home / Landing Dashboard (/main/dashboard)
2. Customer Login Screen (/auth/login)
3. OTP Verification Screen (/auth/otp-verification)
4. Fabric Categories & Materials (/main/with-fabric)
5. Article Selection Screen (/main/article/:articleId)
6. Article Customizer & Details (/main/with-fabric/:articleId/:fabricId)
7. Tailor Listing & Rate Cards (/main/tailor/tailorList)
8. Shopping Bag & Auto-Assign (/main/cart)
9. Order Summary & Checkout (/main/.../order-summary)
10. My Orders & Delivery Tracking (/main/myorder)
11. Delivery Address Book (/main/user/address)
12. Wishlist Collection (/main/user/wish-list)
13. User Menu & Navigation Hub (/main/menu)
14. Tailor Stitching Price List Popover (/stiching-price)

Navigation Flow Diagram:

Home -> With Fabric -> Article -> Details -> Cart (Assign Tailor) -> Order Summary -> My Orders

1. Home / Landing Dashboard

Route Path:

/main/dashboard (redirect from /)

Implementation Status:

Implemented (Active REST + Mock Data)

Core Purpose:

Primary customer entry point. Displays address header, search bar, promotional banner carousel, service category cards (With Fabric / Without Fabric), and embedded top-rated fabric and tailor sections.

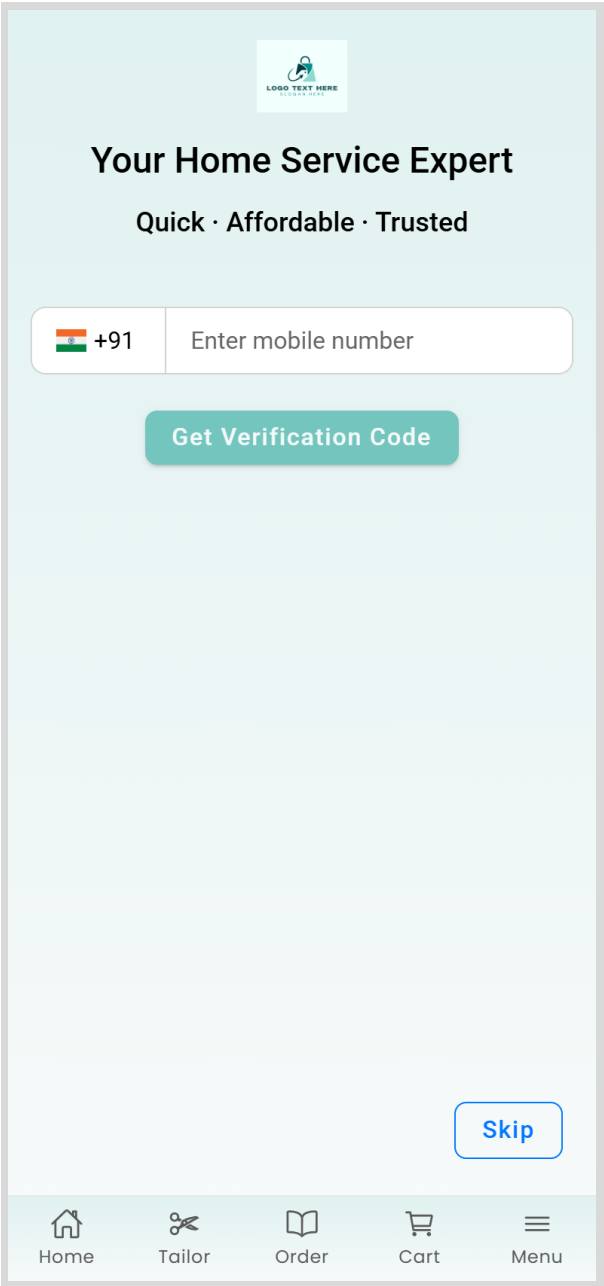

Data Source & APIs:

Articles loaded from GET catalog/api/v1/article; banners and service cards loaded from CommonService in-memory arrays.

Audit Critique & Flaws:

Clean top banner and service layout. Dead links on tailor cards navigating to /tabs/customer/tailors. Search bar autotyping effect is distracting on mobile.

2. Customer Login Screen

Route Path:

/auth/login

Implementation Status:

Implemented (Active REST API)

Core Purpose:

Customer phone number input for passwordless SMS OTP authentication. Includes branding logo, India +91 country prefix, and skip button.

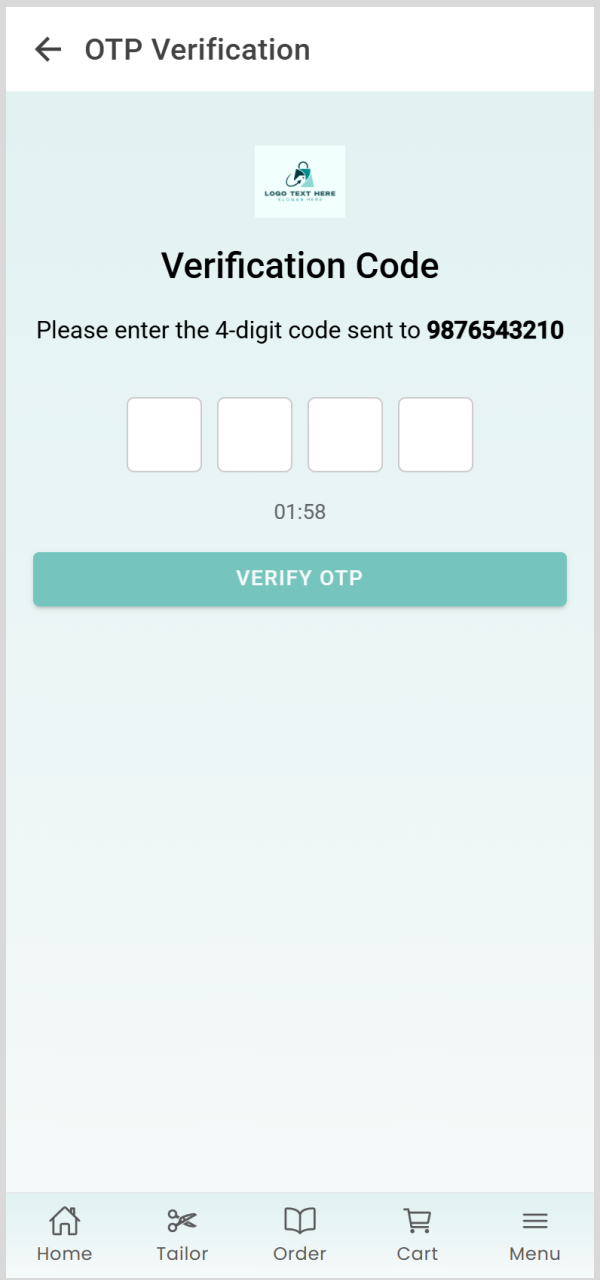

Data Source & APIs:

Calls POST api/v1/auth/send-otp with mobile number payload.

Audit Critique & Flaws:

Simple and clean card interface. Error handler displays misleading "Incorrect username or password" on failure. Lacks country code dropdown for international users.

3. OTP Verification Screen

Route Path:

/auth/otp-verification?phone=9876543210

Implementation Status:

Defective (Hardcoded OTP Value)

Core Purpose:

4-digit OTP code entry with countdown timer and resend capability.

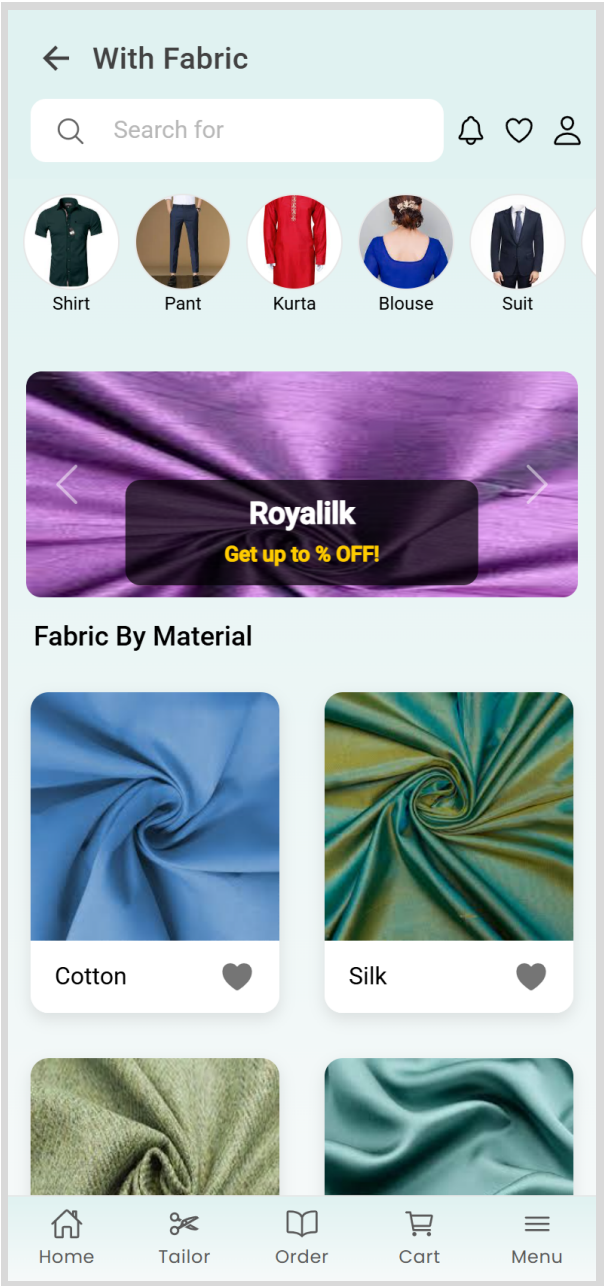

Data Source & APIs:

Calls POST api/v1/auth/verify-otp.

Audit Critique & Flaws:

CRITICAL BUG: Code explicitly hardcodes "123456" in the HTTP payload, ignoring user inputs. Timer interval causes memory leak. Header back button href is broken.

4. Fabric Categories & Materials

Route Path:

/main/with-fabric

Implementation Status:

Partially Implemented (100% Mock Data)

Core Purpose:

Explore fabric types (Cotton, Silk, Linen, Velvet, Denim), weave types, GSM thickness, and color swatches.

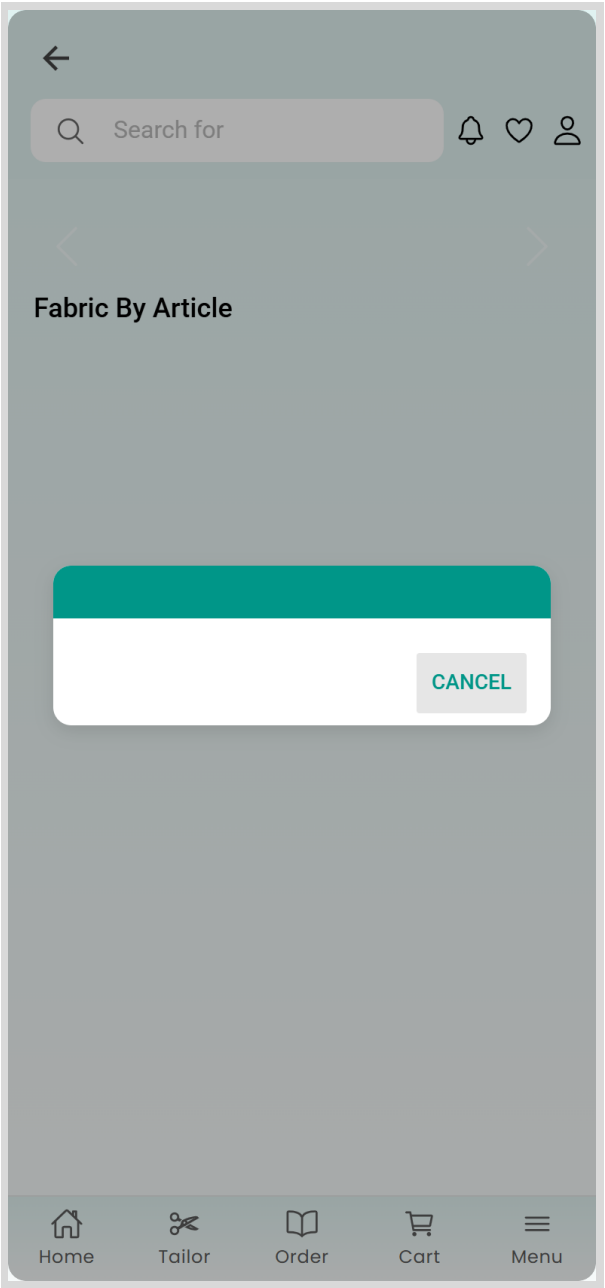

Data Source & APIs:

Loaded from WithfabricService and CommonService hardcoded arrays. No backend API connection.

Audit Critique & Flaws:

Visually rich category cards and color palette swatches. Wishlist button creates duplicate items on multiple clicks. Needs pagination and backend search filters.

5. Article Selection Screen

Route Path:

/main/article/:articleId

Implementation Status:

Implemented (REST API + Mock)

Core Purpose:

Select sub-articles (Casual Shirt, Formal Shirt, Party Shirt) and choose matching fabrics for the chosen garment type.

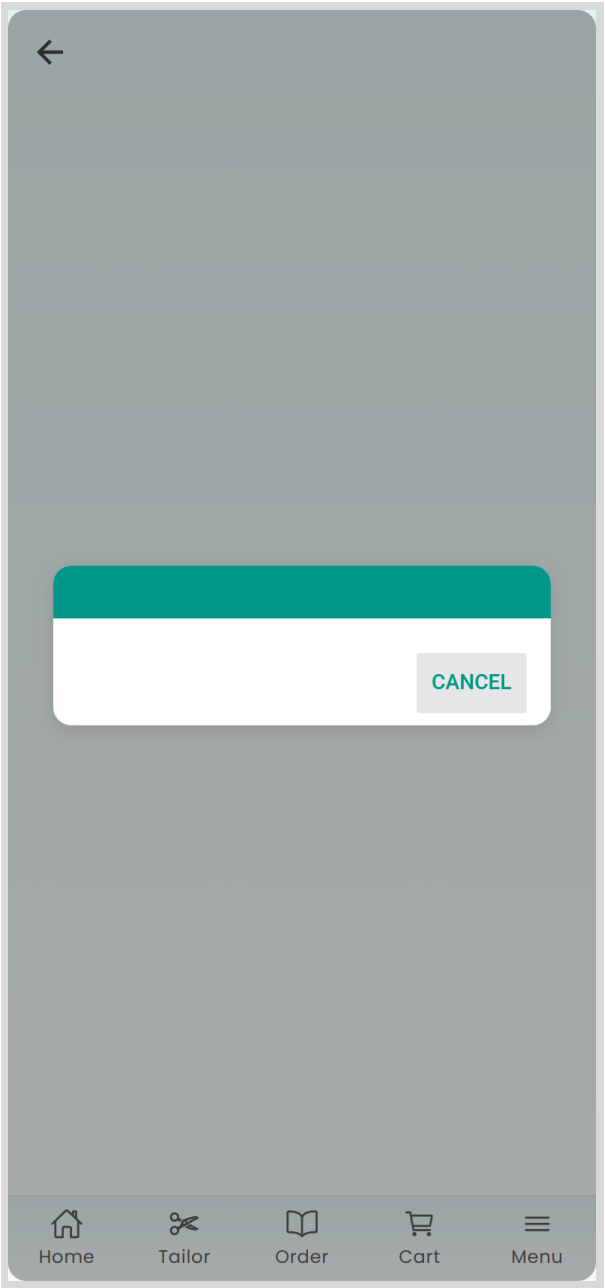

Data Source & APIs:

forkJoin calling GET api/v1/articles/:id/fabric-categories and GET api/v1/fabric/fabric-categories.

Audit Critique & Flaws:

Uses history.state to pass article data, which breaks completely if the user refreshes their mobile browser. Requires URL-driven route parameter resolution.

6. Article Customizer & Details

Route Path:

/main/with-fabric/:articleId/:fabricId

Implementation Status:

Implemented with Cart Bug

Core Purpose:

Garment detail view with image carousel, fabric specifications, color swatches, size chart modal trigger, and Add to Bag / Book Tailor CTA buttons.

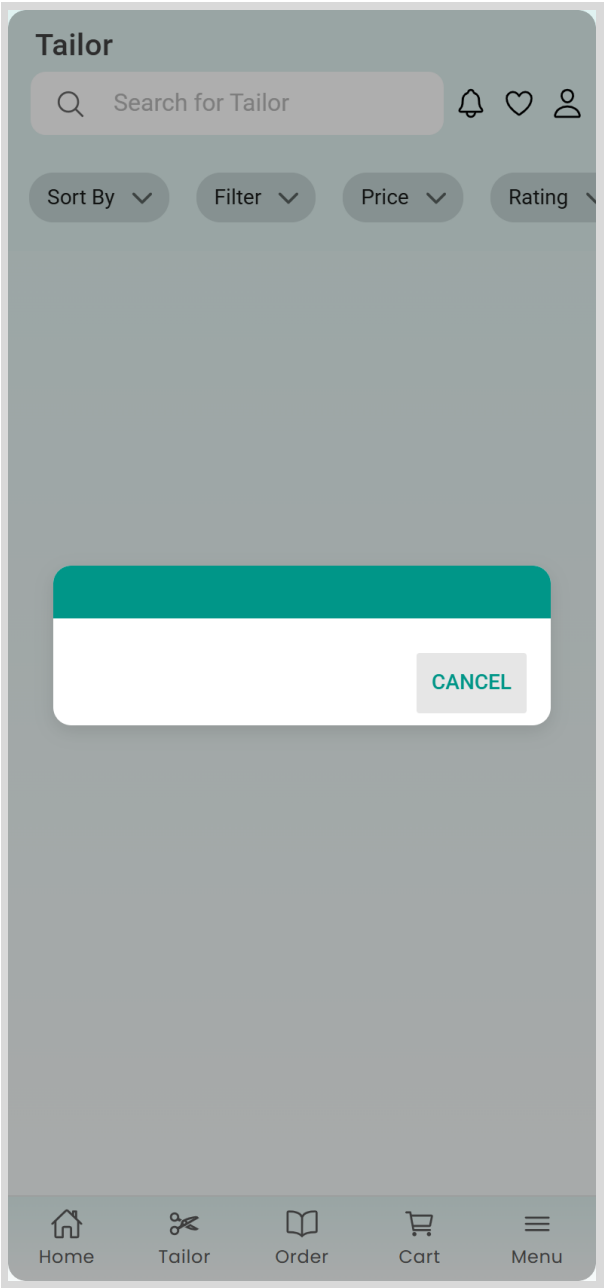

Data Source & APIs:

forkJoin calling fabric category, color variant, and fabric detail APIs.

Audit Critique & Flaws:

High visual appeal with full fabric details. CRITICAL BUG: addToBag() overwrites the shopping bag with only the current item, discarding existing cart contents.

7. Tailor Listing & Rate Cards

Route Path:

/main/tailor/tailorList

Implementation Status:

Implemented (Dual-use View/Modal)

Core Purpose:

Browse nearby tailors, view experience ratings, distance in km, specialties, and open popup stitching price tables.

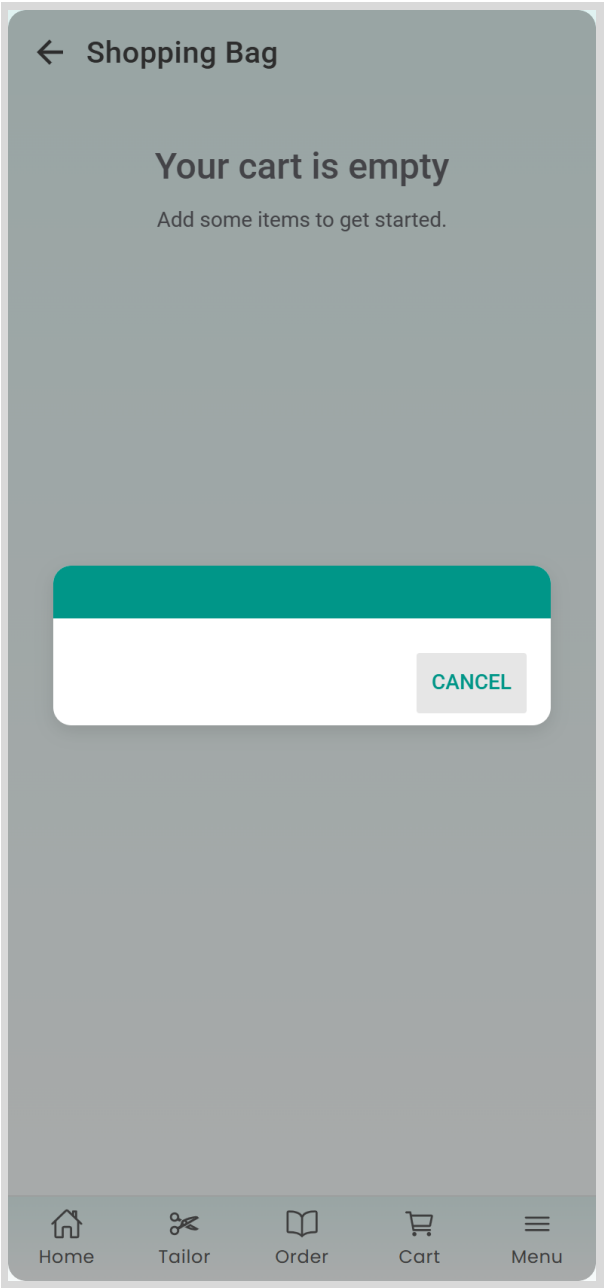

Data Source & APIs:

Calls GET api/v2/tailors for list; calls GET api/v2/tailors/article-stitchingPrice/:id for rate cards.

Audit Critique & Flaws:

Comprehensive tailor cards with avatar, rating, and distance. Sort and filter buttons open dummy modal returning hardcoded dummy data.

8. Shopping Bag & Tailor Assignment

Route Path:

/main/cart

Implementation Status:

Implemented (Architectural Flaws)

Core Purpose:

Cart view showing selected articles, quantity stepper, individual tailor booking, auto-assign tailor based on fabric price tier, and price breakdown.

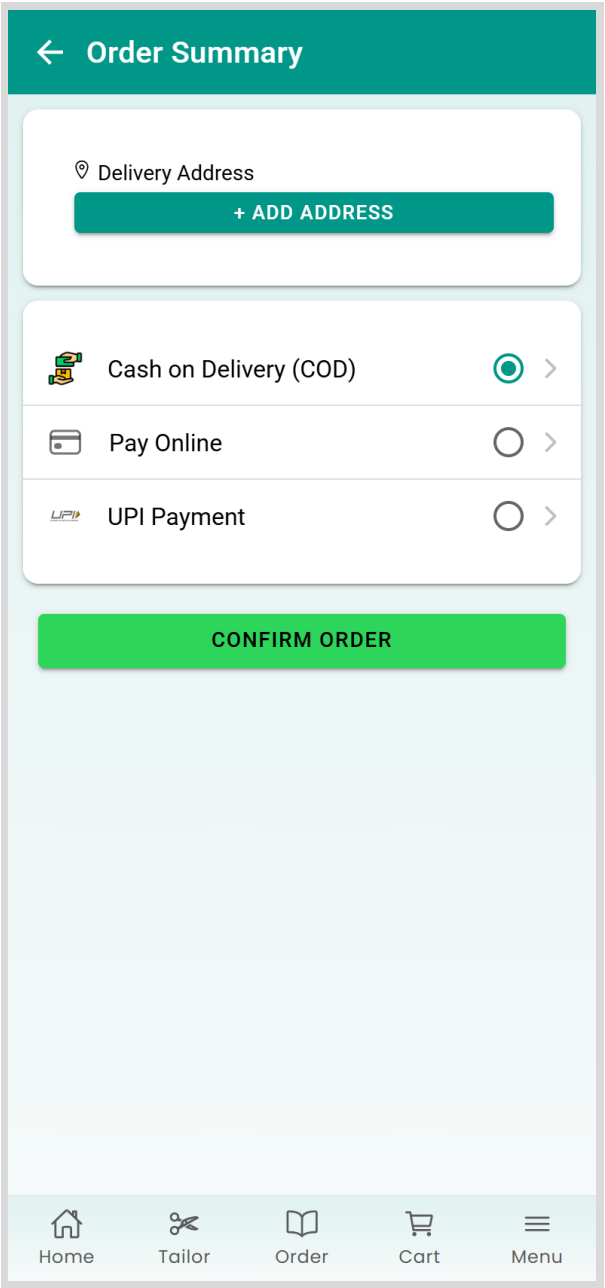

Data Source & APIs:

LocalStorage shopping_bag + GET api/v2/tailors/article-rates + GET api/v2/tailors/.../work-hours.

Audit Critique & Flaws:

Feature-rich concept. Fires N parallel uncoordinated HTTP requests inside a loop. Price calculation function signature has reversed arguments.

9. Order Summary & Checkout

Route Path:

/main/with-fabric/:article/:articleId/order-summary

Implementation Status:

Mock Checkout (No Backend API)

Core Purpose:

Checkout review screen with delivery address selector, delivery date estimation, payment options (Cash on Delivery / UPI), and Confirm Order CTA.

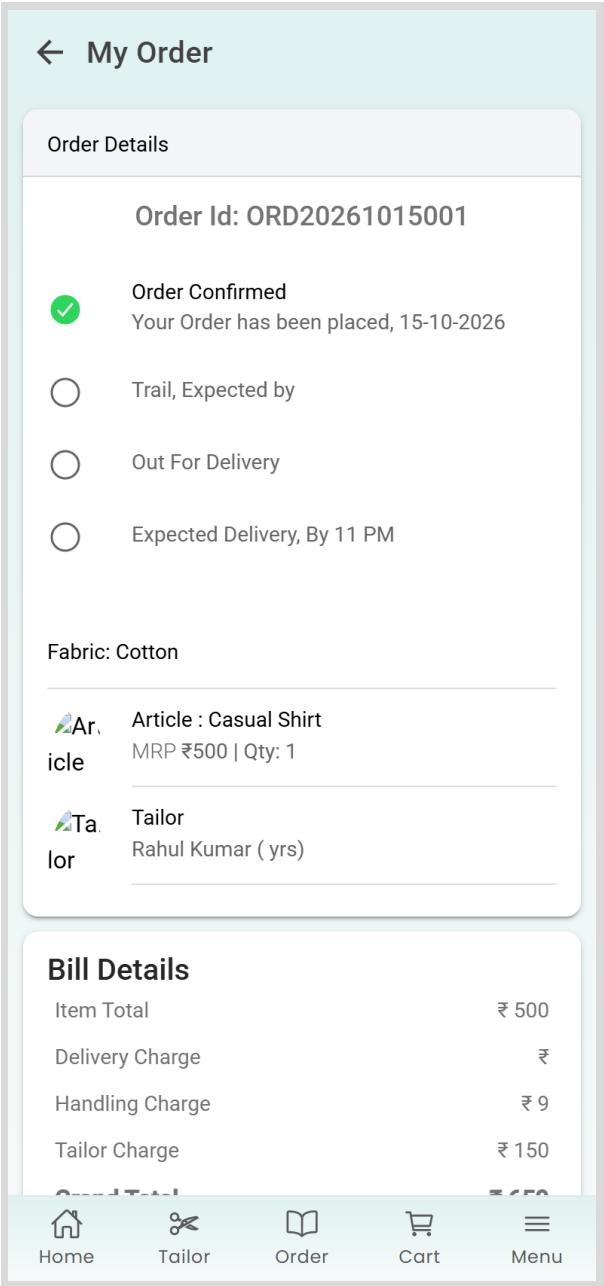

Data Source & APIs:

LocalStorage myOrder + Google Geocoding API.

Audit Critique & Flaws:

Clean order summary with delivery timelines. CRITICAL ISSUE: Order placement only saves to localStorage; no backend order creation API is invoked. Google API key exposed.

10. My Orders & Delivery Tracking

Route Path:

/main/myorder

Implementation Status:

Implemented with Crash Bug

Core Purpose:

Order status tracker using Angular Material stepper showing Booked, Cutting, Stitching, Trial, and Delivered stages.

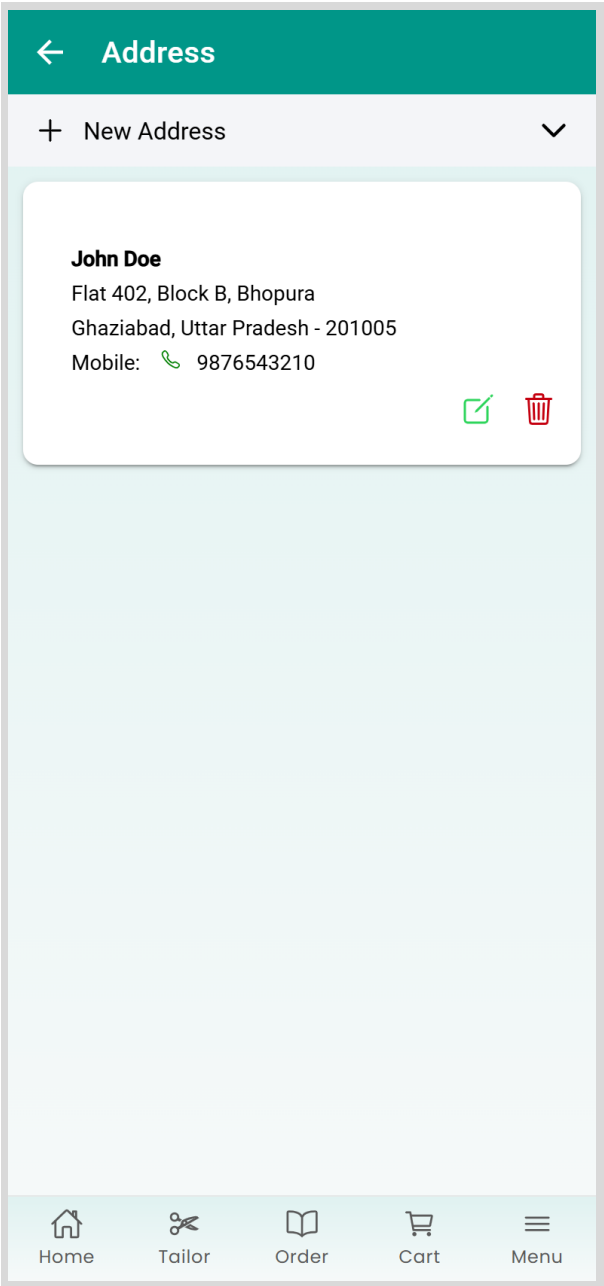

Data Source & APIs:

LocalStorage myOrder array.

Audit Critique & Flaws:

Stepper timeline is visually clear. CRITICAL BUG: Crashes with TypeError when user has zero orders because it reads orderList[0] without verifying array length.

11. Delivery Address Book

Route Path:

/main/user/address

Implementation Status:

Implemented (LocalStorage Only)

Core Purpose:

Form to enter full name, 10-digit mobile number, pincode, state, city, house/flat number, area, and address type (Home/Work).

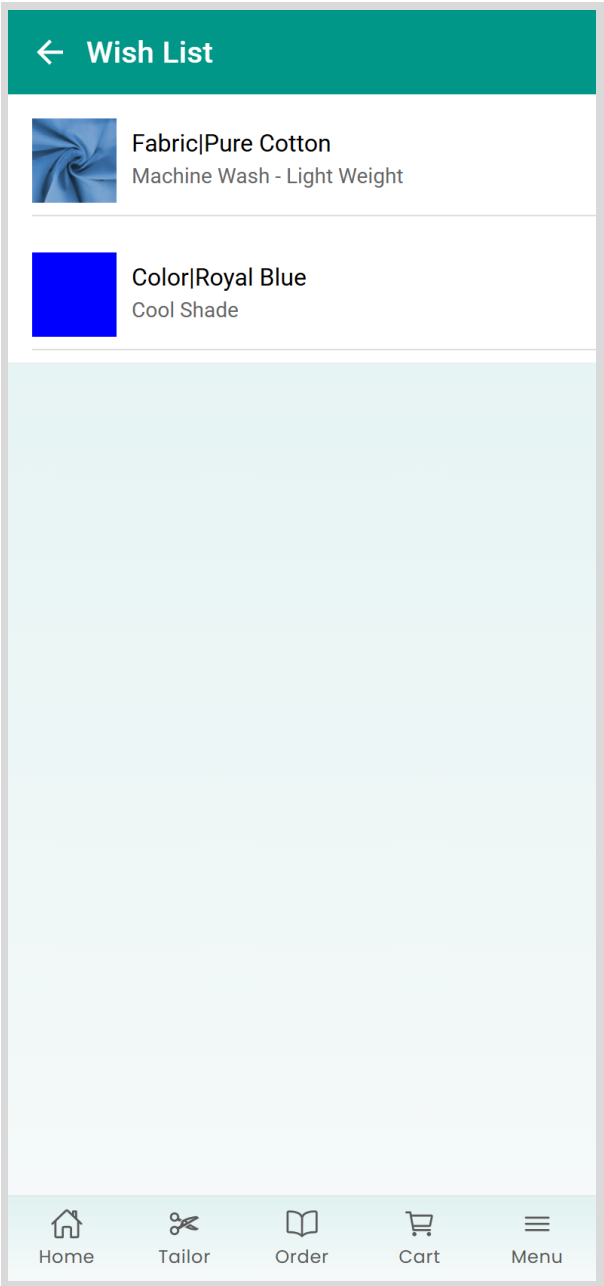

Data Source & APIs:

LocalStorage myAddress.

Audit Critique & Flaws:

Reactive form validation with number sanitization. Addresses are saved purely in browser localStorage without synchronization to user backend profile.

12. Wishlist Collection

Route Path:

/main/user/wish-list

Implementation Status:

Implemented (LocalStorage Only)

Core Purpose:

Display saved fabrics and color swatches.

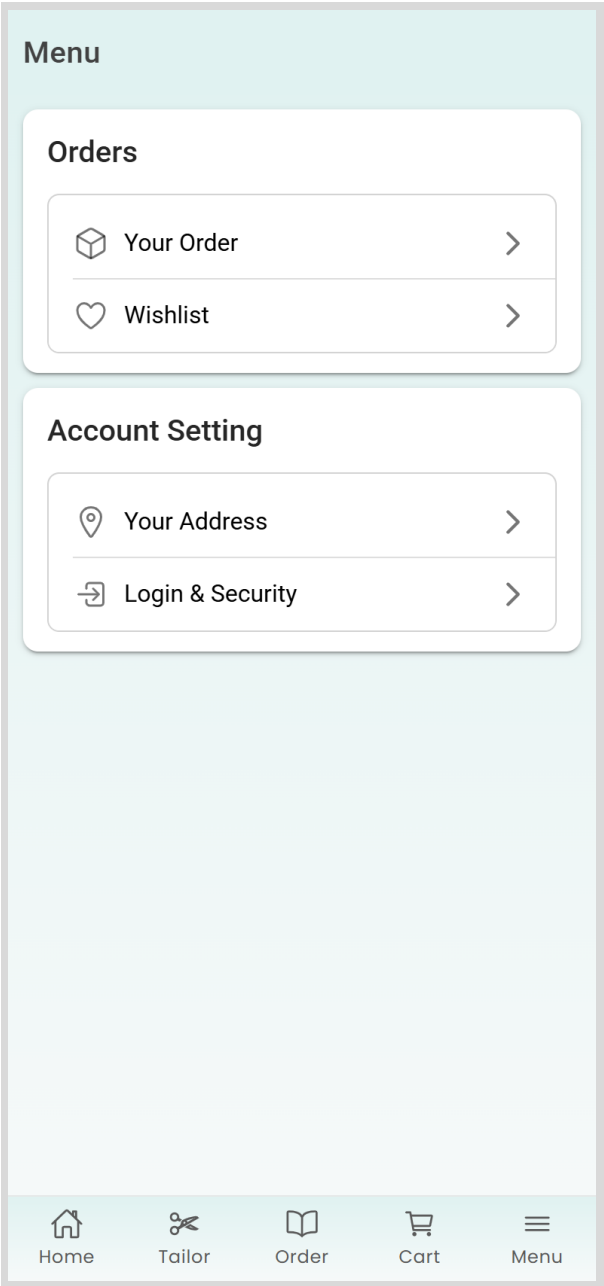

Data Source & APIs:

LocalStorage wish_list.

Audit Critique & Flaws:

Lists bookmarked fabrics with thumbnails and color swatches with hex background. Lacks delete/remove button and pagination.

13. User Menu & Navigation Hub

Route Path:

/main/menu

Implementation Status:

Implemented (Basic Navigation)

Core Purpose:

Account settings navigation with links to Orders, Wishlist, Address, and Login & Security.

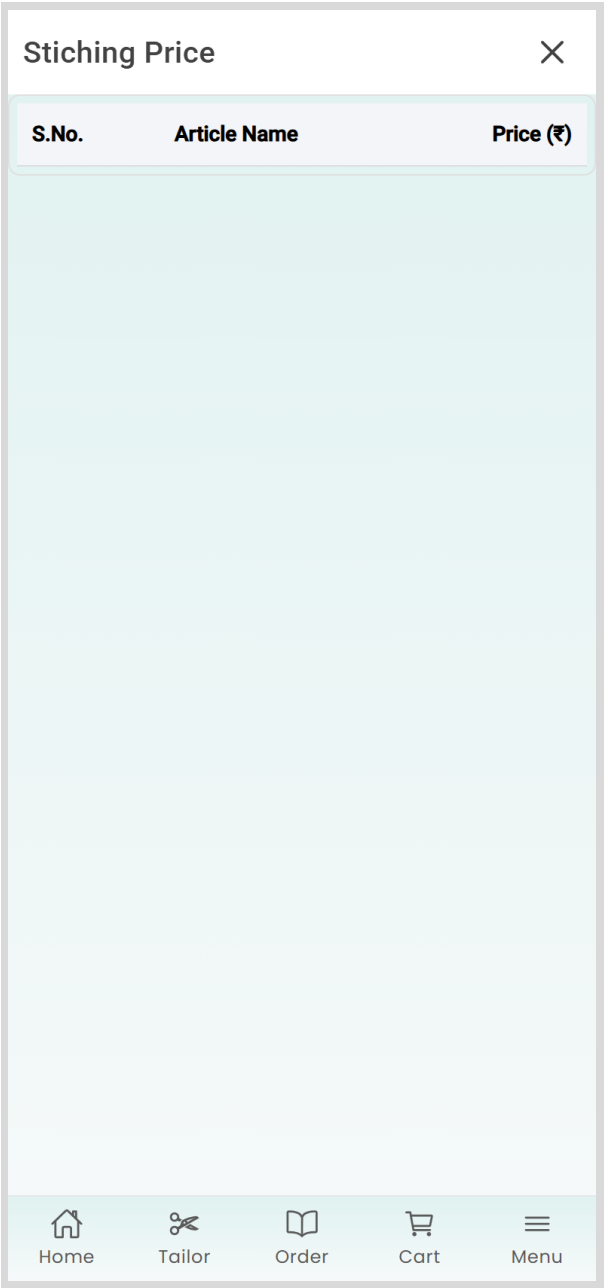

Data Source & APIs:

Static list items.

Audit Critique & Flaws:

Clean list card interface. "Login & Security" item is non-functional. Duplicate unused MenuComponent exists in source code.

14. Tailor Stitching Price Popover

Route Path:

/stiching-price (Popover)

Implementation Status:

Implemented (Popover View)

Core Purpose:

Fixed header table showing article names and corresponding tailor stitching rates in INR.

Data Source & APIs:

Passed via componentProps from TailorListPage.

Audit Critique & Flaws:

Compact, clean modal rate card. Misplaced in model folder; registered unnecessarily as a standalone route in app.routes.ts.
